MACD Trend States, when the signal is Bearish

`_macd_crossover_state()` doesn't just say **bullish** or **bearish** â€” once a weekly MACD line crosses its signal line, it also tracks how that move is **aging**: still accelerating, holding, running out of steam, or about to flip back. Below are four synthetic weekly series, each engineered to land in exactly one of the four trend buckets while the underlying cross stays bearish â€” run through the real function, not approximated.

THE EXACT CLASSIFICATION, AFTER A BEARISH CROSS

```
score = current_diff / peak_diff_since_cross Ã— 100
if today is the new peak            â†’ expanding    (momentum still worsening)
elif score â‰¥ 70                       â†’ holding_strong
elif score â‰¥ 30                       â†’ squeezing
else                                â†’ fading_near_flip  (score < 30)
```

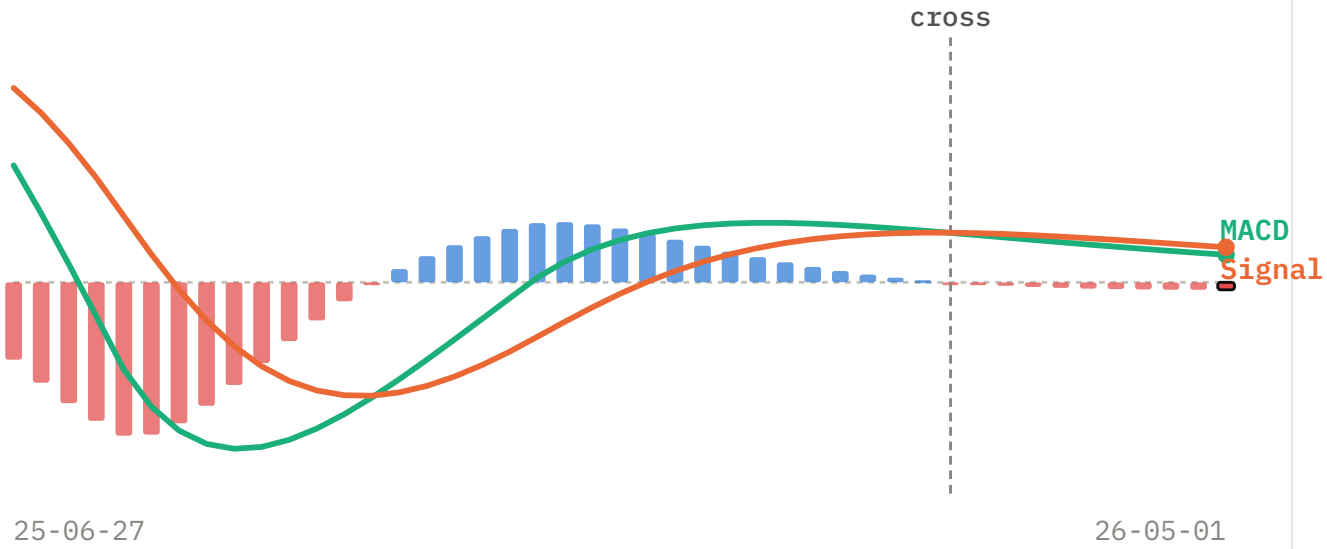

MACD line (EMA12 âˆ’ EMA26) Signal line (EMA9 of MACD) Histogram (bearish, diff < 0)

Histogram (diff > 0, pre-cross)

expanding

STRONGEST CONFIRMATION

Cross is fresh and still digging in

CROSS DATE	WEEKS SINCE	STRENGTH SCORE	LATEST DIFF
2026-02-20	10	100.0	-0.158

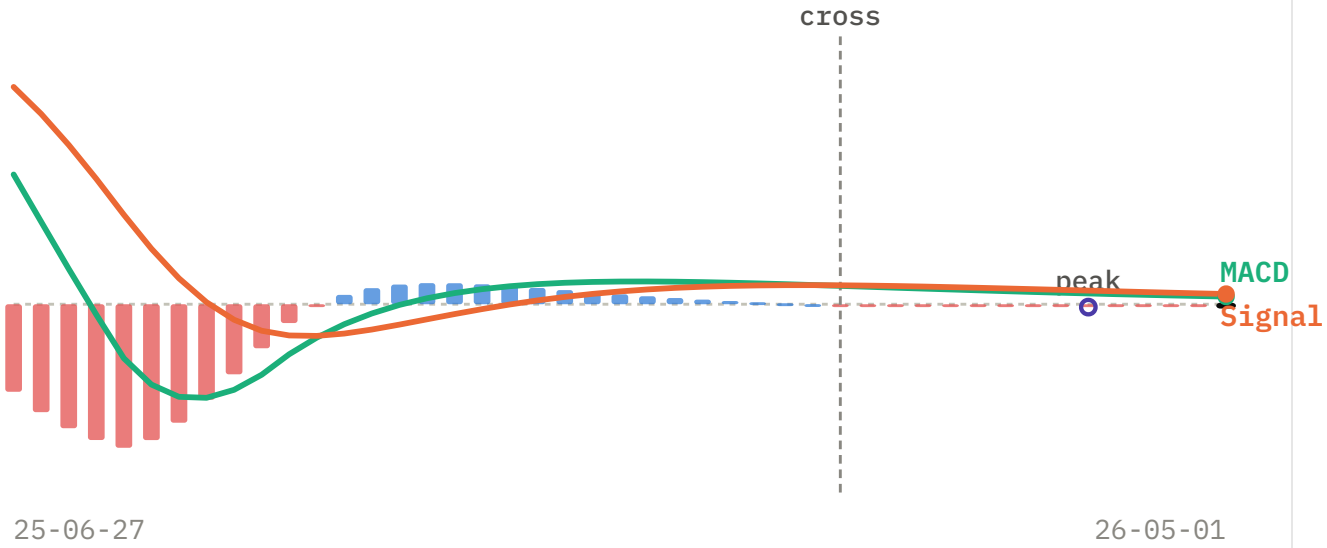

Today's bar is the **most negative point yet** since the cross â€” bearish momentum is still building, not fading. This is the freshest, most reliable read: no reversal risk flagged.

â–¸ View weekly values (45 weeks)

holding_strong

STILL CONFIRMING

Past peak, but barely decayed (score â‰¥ 70)

CROSS DATE	WEEKS SINCE	STRENGTH SCORE	LATEST DIFF
2026-01-23	**14**	**89.7**	**-0.048**

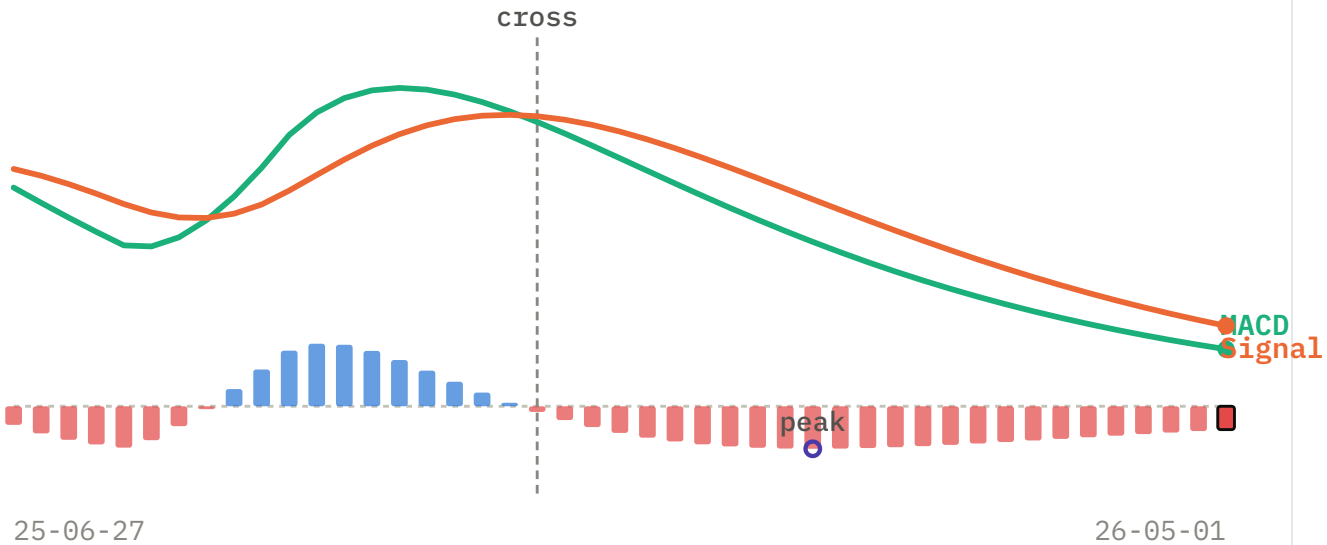

The histogram has passed its most negative point but is still at **â‰¥ 70% of peak intensity**. The bearish read is mature, not fresh, but not in any danger of flipping soon.

â–¸ View weekly values (45 weeks)

squeezing

SOFTENING

Meaningfully decayed (30% â‰¤ score < 70%)

CROSS DATE	WEEKS SINCE	STRENGTH SCORE	LATEST DIFF
2025-11-07	**25**	**54.9**	**-0.490**

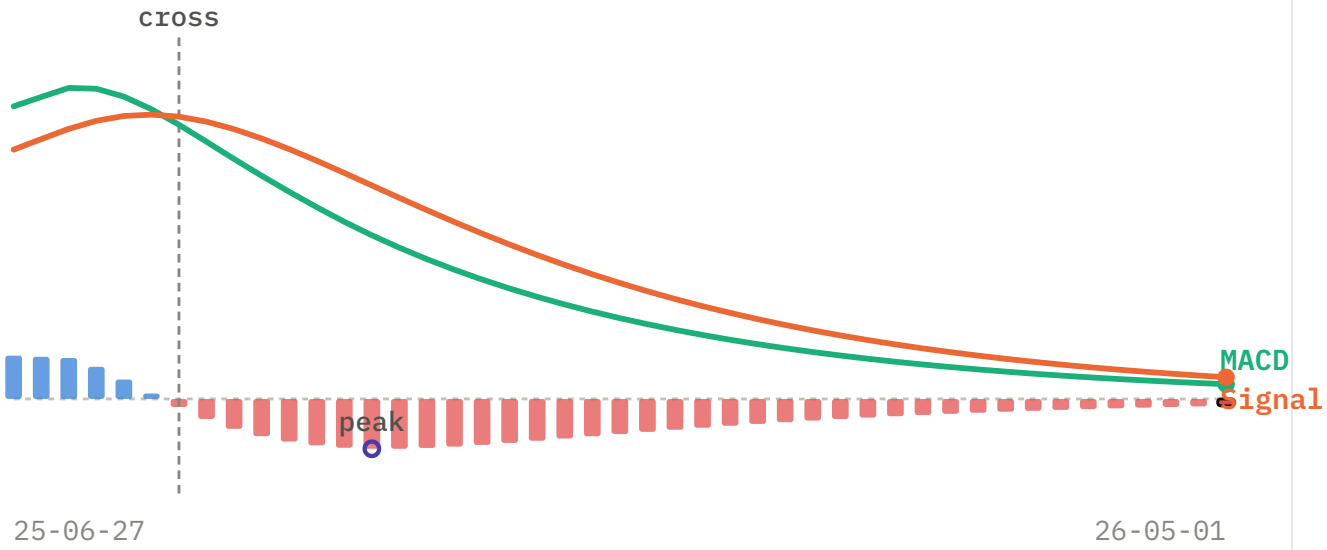

Momentum has faded to **30â€“70% of its peak** â€” the bearish thesis is weakening but there's no urgent flip risk yet. Worth watching, not yet worth discounting.

fading_near_flip

REVERSAL RISK

Nearly back to zero (score < 30%)

CROSS DATE	WEEKS SINCE	STRENGTH SCORE	LATEST DIFF
2025-08-08	**38**	**13.9**	**-0.174**

The histogram has decayed to **under 30% of its peak** â€” still technically bearish, but exhausted enough that a bullish flip could come any week. This is the state that triggers the amber â€œBearish â†—â€ pill and the CC/SP Timing exhaustion caution.

â–¸ View weekly values (45 weeks)

All four series share the same shape up to the cross â€” a rally, then a decline that triggers the bearish flip â€” and differ only in what the price does *after* the cross, which is what determines whether the histogram keeps digging in, holds, or decays back toward zero. Real tickers land here too: **BE** was recently seen at score `8.0` (deep into `fading_near_flip`, 11 weeks post-cross) and **INTC** at `25.8` (same bucket, 10 weeks post-cross) â€” both a hair away from a fresh bullish cross. Hover any chart for the exact weekly values.
